

LHC

John Huth
Harvard University

Outline

- The Accelerator
- General purpose detectors: ATLAS, CMS
- Specialized detectors: ALICE, LHCb

Physics Motivation

- Symmetry Breaking sector: Higgs, Technicolor – other
- Standard model tests: QCD, electroweak
- Exotic matter: extra dimensions, gauge bosons, Supersymmetry (dark matter?)
- CP violation in the B sector
- Quark-gluon Plasma

The Large Hadron Collider

16, Aug,

Large Hadron Collider at CERN

LHC PROJECT

UNDERGROUND WORKS

pp collider $\sqrt{s} = 14 \text{ TeV}$

Dipole field: 8.33 T

P-P collisions $\sqrt{s} = 14 \text{ TeV}$

Bunch spacing 25 nsec

Stored energy/beam 350 MJ

Initial Luminosity $10^{33} \text{ cm}^{-2} \text{ sec}^{-1}$

Ultimate Luminosity $10^{34} \text{ cm}^{-2} \text{ sec}^{-1}$

THE LHC HADRON INJECTOR COMPLEX

Accelerator Challenges

- High luminosity
 - 2835 bunches, 10^{11} protons/bunch
- Beam-beam effects (limits bunch density)
- Collective instabilities (wake fields)
- Beam lifetime
- Quench protection (high stored energy)
- Synchrotron radiation (heat load on cryo)

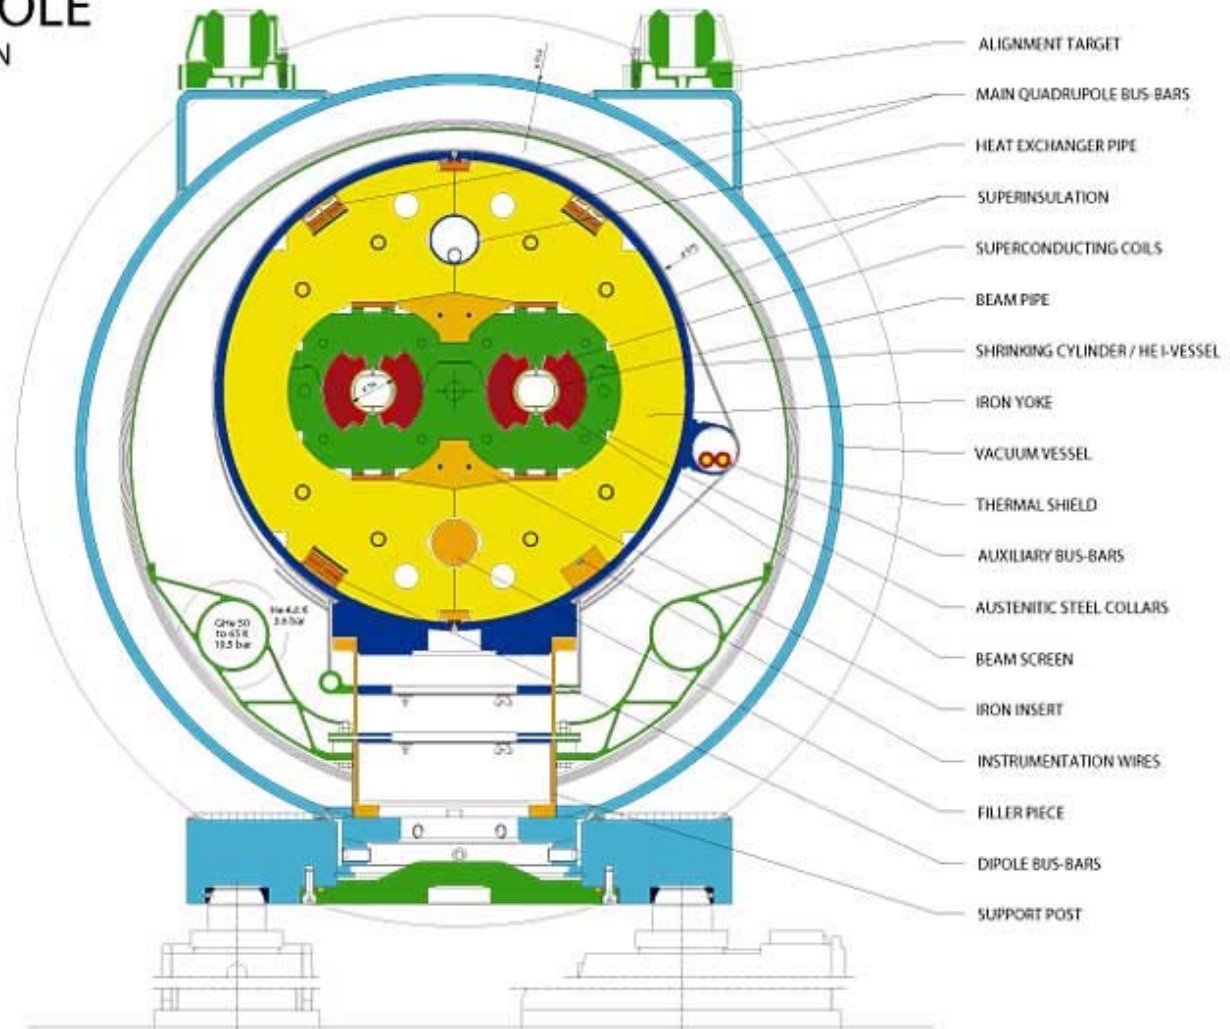

Dipole Configuration

LHC DIPOLE CROSS SECTION

CERN AC/DI/MM — 2001/06

News from the LHC machine

8.4 Tesla

First full LHC cell (~ 120 m long) :
6 dipoles + 4 quadrupoles;
successful tests at nominal current (12 kA)

More than half of the 1232 dipoles are produced

16, Aug, 05

Data provided by T. Tortschanoff AT-MAS

LHC construction and installation

Dipoles ready for installation

Cryogenics (QRL) in the tunnel

Dipole installation in the tunnel

The magnet production proceeds very well and is on schedule, also the quality of the magnets is very good

On the critical path for the first collisions in Summer 2007 is the installation of the LHC in the tunnel, in particular due to delays in the cryogenic services lines (QRL) which in 2004 had problems, and for which a recovery plan was implemented successfully

**Lowering of the first dipole
into the tunnel (March 2005)**

**Installation of dipoles in the
LHC ring has started**

16, Aug, 05

Luminosity Evolution

Cross sections

$\sigma_{pp}(14\text{TeV})$

Events for 10 fb^{-1}

Large production rates

- LHC is a top, b, W, Z factory

Mass reach for new particles up to TeV range

Precision measurements dominated by systematics

Major Higgs signals

$$H \rightarrow \gamma\gamma$$

$$H \rightarrow b\bar{b}$$

$$H \rightarrow ZZ^{(*)} \rightarrow l^+l^-l^+l^-$$

$$H \rightarrow WW^* \rightarrow l^+\nu l^-\bar{\nu}$$

$$H \rightarrow ZZ \rightarrow l^+l^-\nu\nu$$

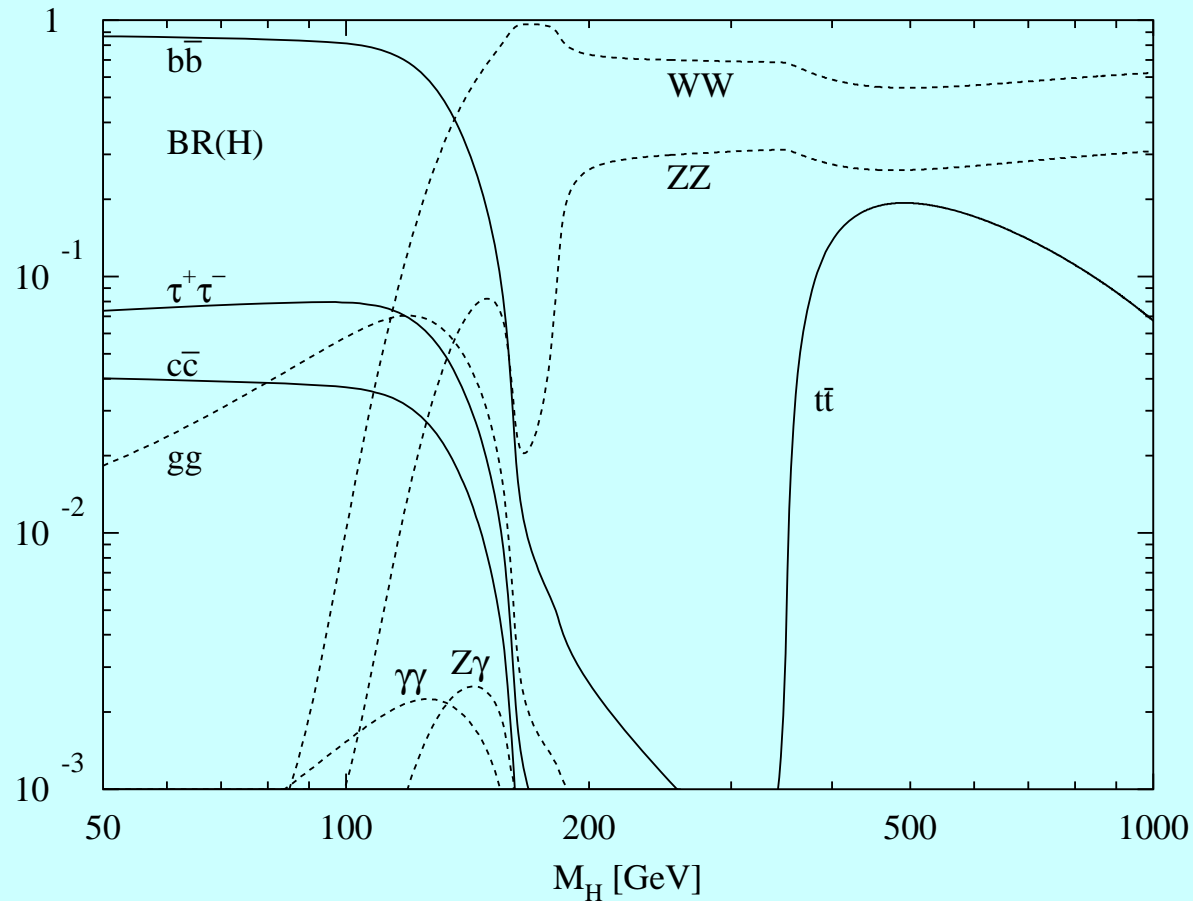

$$H \rightarrow WW \rightarrow l\nu \text{ jet jet}$$

Standard model backgrounds are the largest issues

Detector requirements: B-tagging, lepton ID, photon ID
Jets, missing energy

Higgs Decay Branching Fractions

Higgs Sensitivity

The ATLAS Detector

The ATLAS Magnet System

**3 superconducting
air core toroids**

Fe yoke (calorimeter)

Central Solenoid

**superconducting
solenoid**

- 26m long, 20m outer diameter 1350 tons

Barrel Toroid installation

16, Aug, 05

J.Huth, NEPSR

ATLAS Inner Detector

The Inner Detector (ID) is organized into three sub-systems

Pixels

Silicon Tracker (SCT)

Transition Radiation Tracker (TRT)

ATLAS ID Pixels

The Pixel sub-system is now designed as a fully independent and insertable detector which enables late installation and facilitates future upgrades

The plan is to start with 2 layers (out of 3) for the first physics run in 2006 which can be met within a tight schedule

Pre-production Pixel sensors

Pre-production Pixel module

ATLAS ID SCT

The silicon sensor production is running smoothly, about 20% have been delivered and accepted

Substantial progress can be reported for the optical links, power supplies, and off-detector electronics

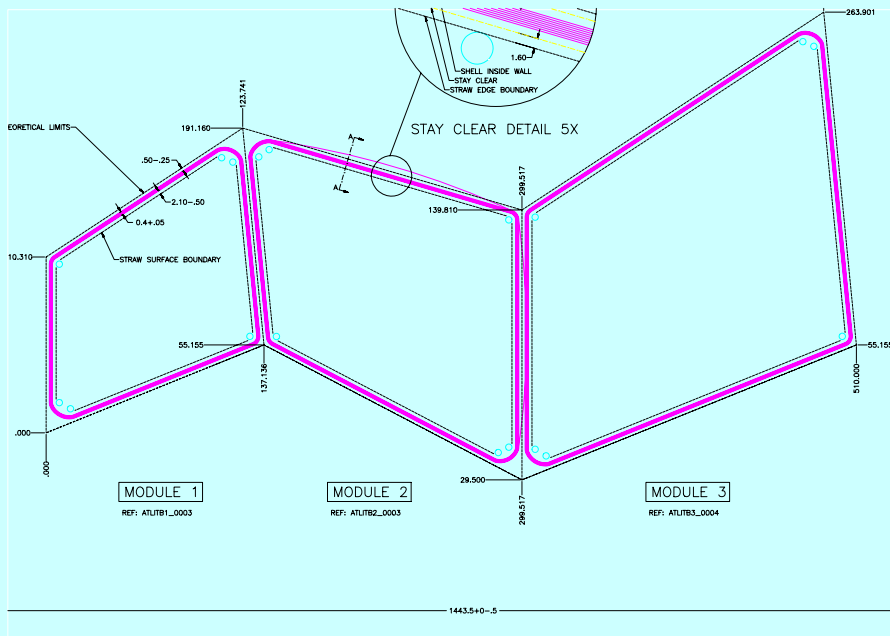

SCT barrel system test

Muon Level 2 Trigger

Radius of curvature map for muons.

Muon reconstruction

1. Identification of Region of Activity
2. Reconstruction of local straight track segments
3. Combination of three tracks segments
4. Global fit taking into account multiple scattering and energy loss

Muon backtracking

Backtracking from Muon System down to beam region through calorimeters taking into account **E loss**, **multiple scattering** and **E loss fluctuations**

E loss from parametrization (from calo measurement possible but risk of pollution from nearby particle)

Combination with inner detector track

μ reconstruction Mass plots

Overall length : 21.6 m
Magnetic field : 4 Tesla

16, Aug, 05

J.Huth, NEPSR

CMS Detector Design: Tracking

Tracker:

- Excellent momentum resolution:
 $\sigma(P_t) / P_t \sim 0.15 (P_t / \text{TeV})$
thanks to 4 Tesla solenoid.
- Coverage to $|\eta| < 2.5$ (i.e. $\theta > 90^\circ$).
- 10000 silicon strip modules.

CMS Detector Design: Tracking

B tagging crucial to reject QCD backgrounds & identify signals (SUSY, Higgs ...)

Relies on silicon pixel detector

- Inner layer only 4.4 cm from beam !
- Gives b-tag for $|\eta| < 2.4$.

CMS Tracker Layout

6,136 Thin sensors - **3112 + 1512** Thin **modules** (ss +ds) **223**
m² of silicon 19,632 Thick sensors - **4776 + 2520** Thick **modules** (ss
+ds) **sensors**

Tracker: Mechanics

M200 Rod for 6 double-sided

modules

TEC

TIB: Upper cylinder mold

Electromagnetic Calorimeter:

CMS Detector Design: ECAL

CMS ECAL made of
80000 PbWO_4 crystals

$H \rightarrow \gamma\gamma$ is main discovery channel for
light Higgs ($M < 150 \text{ GeV}$),
but small branching ratio \Rightarrow difficult

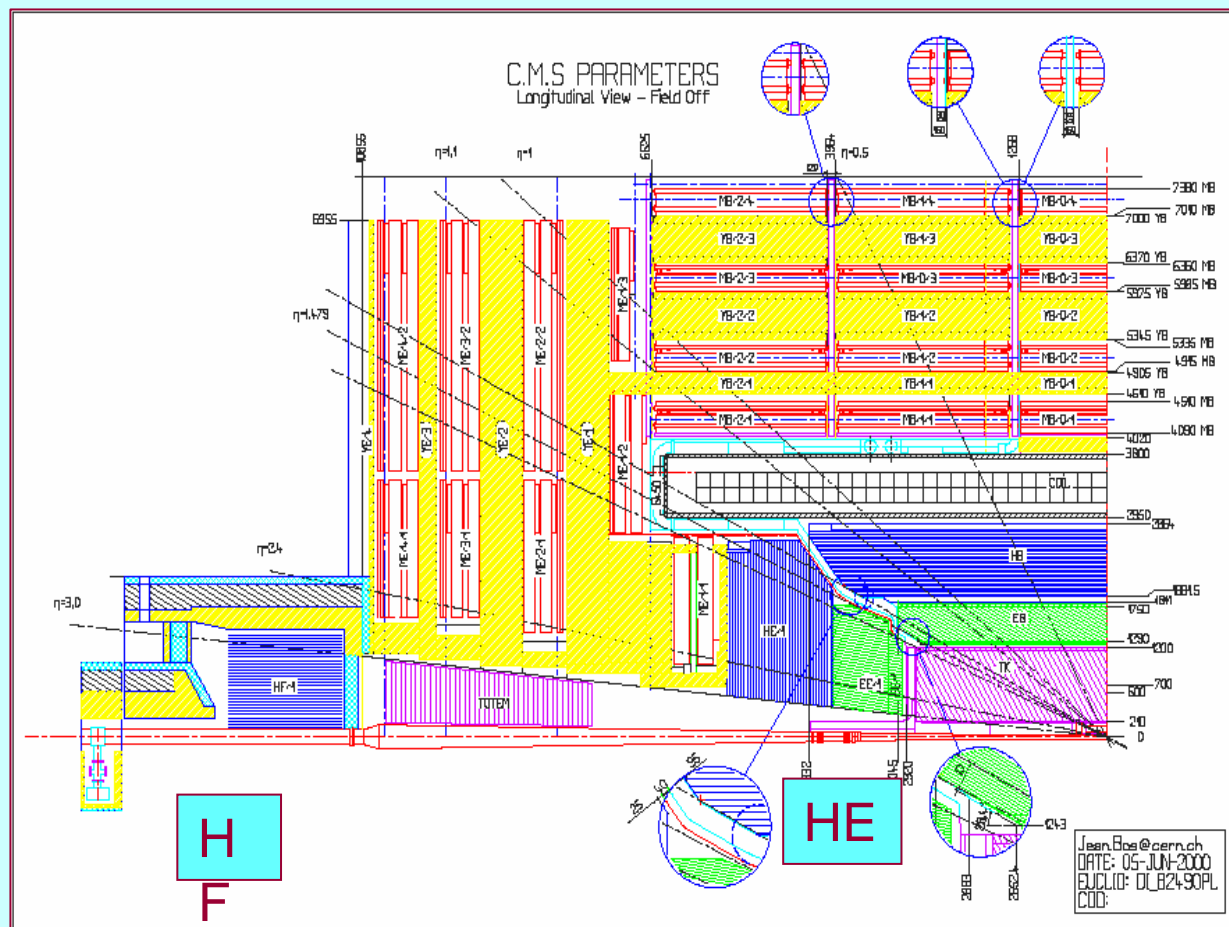

ECAL gives $\sim 0.7 \text{ GeV}$ mass
resolution & $S/B \sim 1/20$.

\Rightarrow Discovery in ~ 1 year.

Hadronic Calorimeter: HCAL

Higgs event into two Photons

$H \rightarrow \gamma\gamma$, $M_H = 100 \text{ GeV}$

CMS Detector Design: μ -chambers

3 different technologies:

DT in barrel

CST in end-cap (due to B-field)

RPC mainly to help trigger (fast).

Excellent momentum resolution

$$\sigma(Pt) / Pt \sim 0.05 \sqrt{Pt / \text{TeV}}$$

as measured in tracker + μ -chambers

Vital for LHC physics:

$$\chi_2^0 \rightarrow \chi_1^0 l^+ l^-$$

$$t \rightarrow b \mu \nu$$

$$Z' \rightarrow 2 \mu \quad (\text{TeV range})$$

$$H \rightarrow ZZ \rightarrow 4 \mu \quad (150\text{-}750 \text{ GeV})$$

10, Aug, 03

J.Huth, NEPSR

ATLAS versus CMS ?

ATLAS & CMS have very similar performance.

But some differences ...

- **ATLAS 2 X bigger !**
- **ATLAS μ resolution better in forward region (toroidal B-field).**
- **ATLAS ECAL worse and outside solenoid $\Rightarrow H \rightarrow \gamma\gamma$ width doubles.**
- **ATLAS jet energy resolution 40% better (ECAL+HCAL combination better).**
- **ATLAS B-field only 2 Tesla \Rightarrow Pt resolution doubles.**
- **ATLAS Transition Radiation Tracker $\Rightarrow \sim 1\sigma$ π -K separation for $p < 20$ GeV.**

ALICE

**Heavy Ion experiment – explore
Quark-Gluon plasma**

**Recent results in jet quenching at
RHIC – extensions at higher energy**

**Running time limited by switchover
For heavy-ions**

Jet Quenching at RHIC

Computing at the LHC

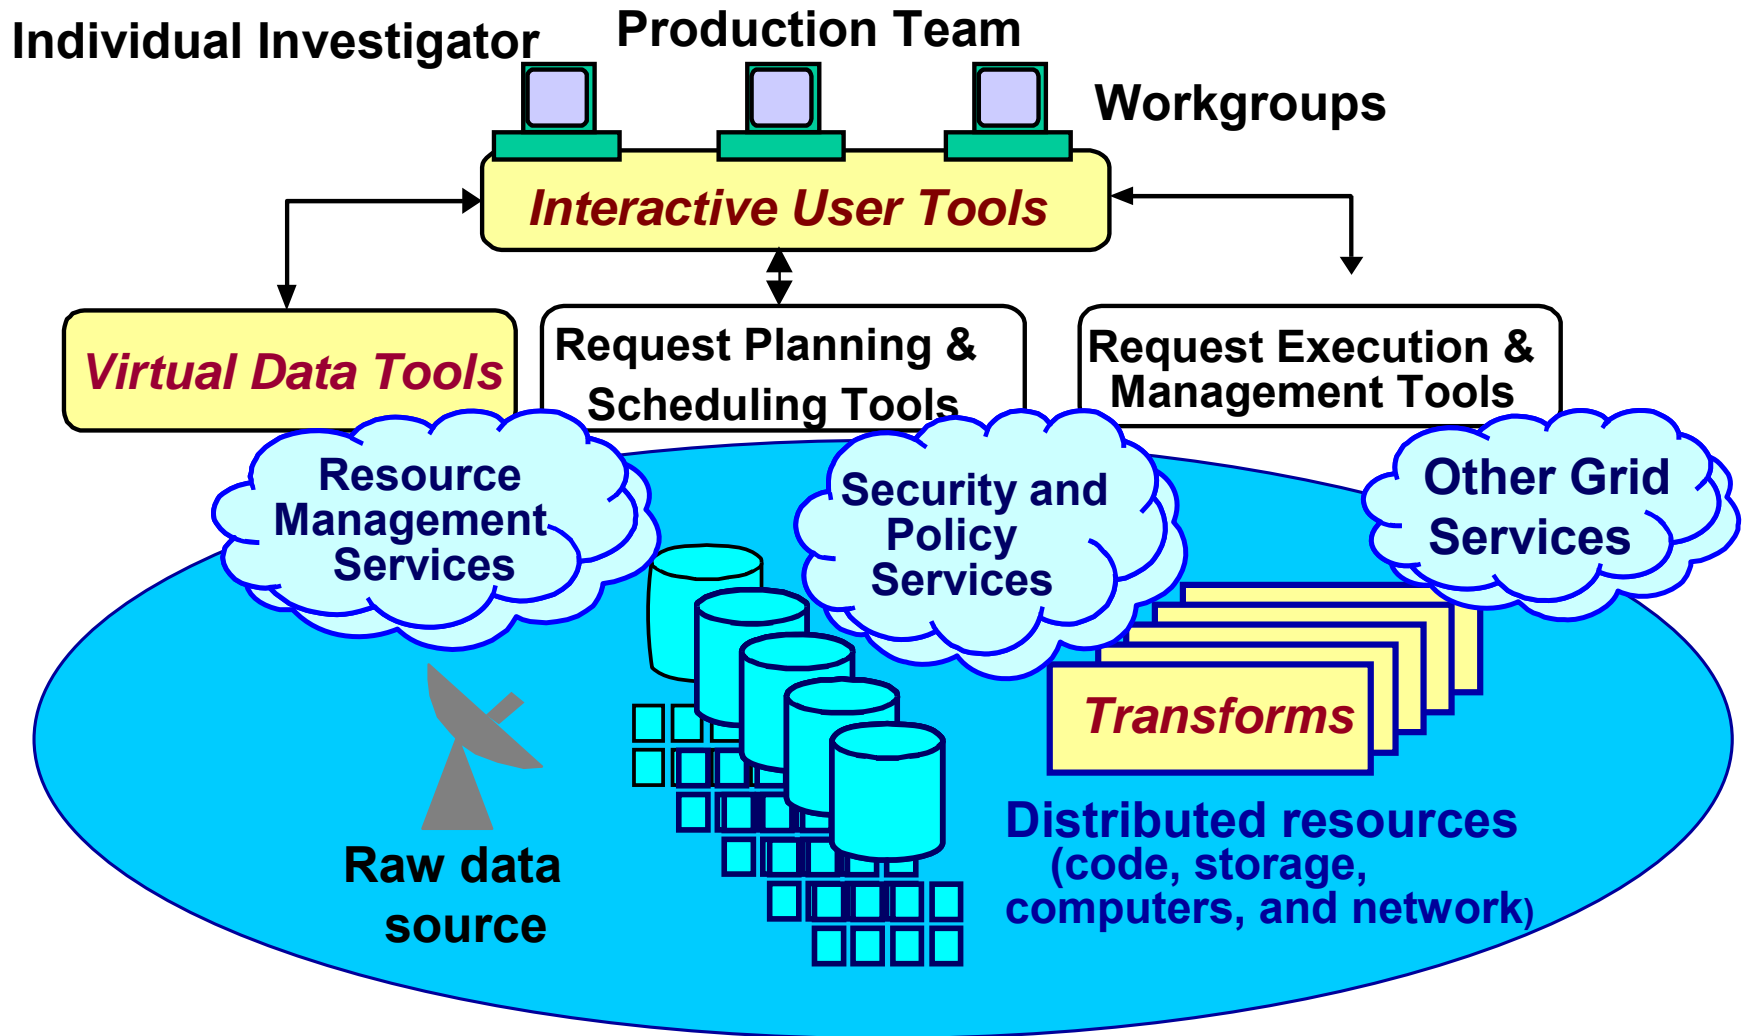

- Setting the scale: relative to Tevatron
 - Collaboration size: 5x (at turn-on)
 - Data volume: 10x (event size, output rate)
 - CPU requirements 100x (pattern recognition, complexity)
 - NB above numbers depend on factors such as trigger configuration, reconstruction algorithms etc.

Grid Computing

- Main issue: democracy of data access, locality of resources
- Design up-front the ability of collaborators to have seamless access to data, resources from home institutions
- Major elements:
 - Grid “middleware”
 - Hierarchy of computing centers

working on one or more channels

CS-Physics Issues

- Resource requirement estimation from small set of parameters
- Interoperability in a heterogeneous environment
- Security, ease of use
- Virtual data: ability to make data “materialize” from an application signature

Summary Comments

- Physics at the LHC is exceedingly rich!
- We need experimental data for theories to advance
- Contact with symmetry breaking
- Accelerator, Detectors, Computing: All a challenge – complexity, backgrounds, energy
